

Introspection

Introspection is the ability to **query which resources are available in the current API schema**. We can see the queries, types, fields it supports.

```
{  
  __schema {  
    queryType {  
      name  
      description  
    }  
  }  
}
```

GraphiQL

GraphiQL offers syntax highlighting, code completion, and error warning, and it **lets you run and view query results directly in the browser.**
