

Resolver

The principal unit of execution in GraphQL API is the **resolver**. It's a **Function with single purpose, providing data for single GraphQL Field.**

```
(root, args, context, info) => {  
  //return data from anywhere  
};
```

```

query {
  name
  age
  friends(first: 3) {
    bestFriend {
      name
    }
  }
}

```
