Schema Definition Language
express the **relationships**
and the shape of the data
to return

Schema

GraphQL uses a strong type system to define the capabilities of an API. They are exposed in an API using a **Schema Definition Language (SDL)**.

```
type Person {  
  id: ID!  
  name: String!  
  age: Int!  
  posts: [Post!]!  
}  
  
type Post {  
  title: String!  
  author: Person!  
}
```
